Active Esters of Formic Acid as Useful Formylating Agents: Improvements in the Synthesis of Formyl-Amino Acid Esters, N-α-Formyl-Met-Leu-Phe-OH, and Formyl-Met-Lys-Pro-Arg, a Phagocytosis Stimulating Peptide

Jean Martinez*, Jeanine Laur

The formyl group is a useful amino-protecting group in peptide synthesis and can, for example, serve in combination with the selectively removable tert-butoxycarbonyl group in the synthesis of suitable protected trifunctional amino acid derivatives. Another interesting aspect of formyl-amino acid esters is their ready conversion to isocyanic acid esters which are required as one of the starting material in four component condensations.

The formulation of amino groups is generally achieved by reaction of the amine with formic acid and acetic anhydride. However, it has been found in many cases that this method is somewhat unreliable. Recently, other methods for preparing formyl-amino acids and formyl-peptides have been proposed: tert-butyl esters of amino acids have been formylated using formic acid and dicyclohexylcarbodimide, and the same system has been used in the synthesis of N-α-formyl-Met-Leu-Phe, a chemotactic peptide. One of the main disadvantages of this method is the formation of dicyclohexylurea as side product which is very difficult to remove from the above chemotactic peptide. Recently, the use of 3-methylbutanoyl chloride or 2,2-dimethylpropanoyl chloride in the presence of formic acid has been proposed for the introduction of the formyl group. Disadvantages such as odor and unpractical use of these acid chlorides prompted us to search for a more interesting, clean, and rapid method of formylation. One of the cleaner methods in peptide synthesis is the active ester method. p-Nitrophenyl formate (1) and o-nitrophenyl formate have been prepared but only rarely used in peptide synthesis.

We have now prepared p-nitrophenyl formate (1) and 2,4,5-trichlorophenyl formate (2) (Scheme A) and studied their use in the synthesis of formyl-amino acid esters and formyl-peptides.

Scheme A

The active formate esters 1 and 2 were prepared by reaction of formic acid with the corresponding phenol in the presence of dicyclohexylcarbodiimide, the products being obtained after 3 h by precipitation from the reaction mixture by ethanol/water. Compound 2 is the more stable and can be stored without any special precautions. Both esters 1 and 2 show high reactivity towards nucleophiles and were used to prepare formyl-Leu-OCH₂C₆H₅ and formyl-Ala-OC₆H₄-Cl in good yield and high purity. The usefulness of 1 or 2 was further demonstrated by the synthesis of the chemotactic peptide 6 (Scheme B). Each intermediate was obtained in a high degree of purity and high yield. The formyl group was introduced using either 1 or 2 and the peptide 5 was obtained as a pure, crystalline material in high yield.

Scheme B

The difficulties reported in preparing this peptide in pure form were not encountered when using 1 or 2. Side products obtained during the synthesis of formyl-amino acid tert-butyl esters were not detected.

The protected peptide 5 was hydrogenated in a mixture of dimethylformamide, diisopropylethylamine, and water in the presence of 10% palladium on barium sulfate to give 6 as pure, colorless needles. The usual hydrofluoric acid treatment at this stage is advantageously replaced by hydrogenation. The chemotactic peptide 6 was identified by comparison of its physical properties with those given for an authentic sample prepared by other routes.

Ester 2 was also used to prepare the partially protected peptide 13 (Scheme C). The peptide Leu-Lys-Pro-Arg, an analog...
of Tuftsin\(^\text{a}\), is highly potent in stimulating phagocytosis of polymorphonuclear leukocytes\(^\text{a}\). It is well known that methionine and leucine can replace each other in natural analogs of several biologically active peptides (e.g. porcine and human gastrin, enkephalins, etc.). We thus expected that replacement of leucine by methionine in this Tuftsin analog would result in an active product. However, it was recently reported that, in addition to promoting cell locomotion, a further biological function of leucotactants (formyl-peptides) may be their capacity to render complement receptors more freely available, thereby increasing the magnitude of adhesion of phagocytic cells to opsonized particles\(^\text{b}\). Thus, 13 could be a possible leucotactant and phagocytosis-stimulating peptide.

Scheme C

The partially protected tripeptide trifluoroacetate salt 7\(^\text{c}\) was reacted with the protected methionine\(^\text{e}\), the resultant fully protected tetrapeptide 8 was hydrogenated as described above to give 9 which was purified by silica gel chromatography. Treatment of 9 with trifluoroacetic acid gave, after purification, Met-Lys-Pro-Arg (10). Alternatively, treatment of the peptide 8 with trifluoroacetic acid gave the trifluoroacetate salt of the peptide 11. Reaction of 11 with reagent 2 gave the formyl-peptide 12 which was partially deprotected by hydrogenation as described previously to give formyl-Met-Lys-Pro-Arg (13). Both peptides 10 and 13 are able to stimulate phagocytosis of polymorphonuclear leukocytes, the results of these studies will be published elsewhere.

The main advantages of using the active esters 1 or 2 are:
- the ester 2 can be simply prepared and stored,
- formyl-amino acids and formyl-peptides are obtained in high yield and high purity,
- the process is experimentally simple.

Capillary melting points were obtained in a Tottoli apparatus and are uncorrected. Thin layer chromatograms were run on commercial silica gel plates (Merek). Spots were detected by U.V. absorption and by charting. Elemental analyses were performed by "Le Service Central de Microanalyse du CNRS de Montpellier". I.R. spectra were determined with a Beckmann Accubal 4 spectrophotometer in KBr pellets, \(^1\text{H}-\text{N.M.R.}\) spectra for 10% solutions in CDCl\(_3\) with a Varian A 60 spectrophotometer using TMS as internal standard (chemical shifts are reported in \(\delta\) values of ppm units). Amino acids of \(\text{t}\)-configuration are used.

**p-Nitrophenyl Formate (1):**
To a cooled (0 \(\degree\)C) solution of 98% formic acid (3 g) in ethyl acetate (50 ml) are added \(p\)-nitrophenol (7.6 g, 5.5 mmol) and di-tert-butyl dicarbonate (11.3 g, 5.5 mmol). The mixture is stirred at 0 \(\degree\)C for 1 h and at room temperature for 3 h. The precipitated di-tert-butyl dicarbonate is filtered and washed with ethyl acetate (2 x 50 ml). The combined organic solution is washed with saturated sodium hydrogen carbonate solution (1 x 50 ml), water (2 x 50 ml), dried with sodium sulfate, and concentrated in vacuum at 40 \(\degree\)C. The residue is dissolved in ethanol (50 ml), addition of water (150 ml) gives a crystalline precipitate which is rapidly filtered, washed with cold ethanol (2 x 10 ml), and dried in vacuum. This product is very stable when not absolutely pure; yield: 6 g (72%); m.p. 65–68\(\degree\)C.

\([\text{C}_2\text{H}_4\text{NO}_4]\) calc. C 50.31 H 3.02 N 8.38
(167.1) found 50.44 3.05 8.37

**2,4,5-Trichlorophenyl Formate (2):**
Similarly prepared from 2,4,5-trichlorophenol; it can be stored at room temperature; yield: 75%; m.p. 68–70\(\degree\)C (Ref.\(^\text{f}\); m.p. 66–67\(\degree\)C. It was recrystallized from bromo ether.

\([\text{C}_2\text{H}_3\text{ClO}_2]\) calc. C 37.28 H 1.34 Cl 47.16
(225.5) found 37.59 1.53 46.98
I.R. (KB): \(\nu = 1730 \text{cm}^{-1}\) (C=O).

**Formyl-L-Leucine Methyl Ester:**
A solution of Leu-OCH\(_3\) hydrochloride (0.80 g, 4.4 mmol) in dimethylformamide (5 ml) containing disopropylethylamine (0.76 ml, 4.4 mmol) is cooled in an ice bath. 2,4,5-Trichlorophenyl formate (2; 0.902 g, 4.4 mmol) is added and, after 30 min at 0 \(\degree\)C, the reaction mixtures are allowed to warm to room temperature over 2 h. The solution is concentrated in vacuo and the residue is dissolved in ethyl acetate (50 ml). The organic solution is washed with saturated sodium carbonate solution (2 x 25 ml), water (25 ml), 5% citric acid solution (25 ml), water (25 ml), dried with sodium sulfate, and concentrated in vacuo. Filtration through a silica gel column gives a colorless oil which is homogeneous by T.L.C. and is identified by its \(\text{H}-\text{N.M.R.}\) spectrum; yield: 75%.

\([\text{H}-\text{N.M.R.} (\text{CDCl}_3)]\): \(\delta = 0.95\) (d, 6 H, CH\(_3\)); 1.70 (s, 3 H, CH\(_3\)); 3.75 (s, 3 H, OCH\(_3\)); 4.75 (m, 1 H, CH—CO—\(\cdot\)); 7.30 (d, 1 H, NH); 8.25 ppm (s, 1 H, —CH=O).

**Formyl-L-alanine \(1\)-butyl ester** is prepared similarly; yield: 78%.

\([\text{H}-\text{N.M.R.} (\text{CDCl}_3)]\): \(\delta = 1.4\) (d, 3 H, CH\(_3\)); 1.5 (s, 9 H, t-C\(_3\)H\(_7\)); 4.1 (m, 1 H, CH—CO—\(\cdot\)); 7.30 (d, 1 H, NH); 8.25 ppm (s, 1 H, —CH=O).

**Boc-Leu-Phe-OCH\(_3\)C\(_6\)H\(_5\) (3):**
To a cooled (0 \(\degree\)C) solution of Boc-Leu-O-succinimidinate (Bachem: 2.5 g, 7.9 mmol) in dimethylformamide (10 ml) is added the phenylalanine salt of 1-Phe-OCH\(_3\)C\(_6\)H\(_5\) (3.71 g, 8.7 mmol) and disopropylethylamine (1.3 ml) in dimethylformamide (10 ml). The mixture is stirred at room temperature for 12 h and then concentrated in vacuo at 40 \(\degree\)C. The residue is dissolved in ethyl acetate (150 ml), the organic layer is washed as described above, dried with sodium sulfate, and concentrated in vacuo; yield: 2.8 g (75%); m.p. 103–105\(\degree\)C (from ethyl acetate/light petroleum ether); \([\text{[r]}]^{20}\) = –10.9 (c 1.1, DMF); homogeneous by T.L.C.

\([\text{C}_2\text{H}_4\text{N}_2\text{O}_5]\) calc. C 69.18 H 7.76 N 5.98
(488.7) found 69.04 7.68 5.80

**Boc-L-Val-Phe-OCH\(_3\)C\(_6\)H\(_5\) (4):**
Compound 3 (2.7 g, 5.8 mmol) is treated with trifluoroacetic acid (10 ml) for 40 min. The trifluoroacetic acid is evaporated in vacuo and the residue is triturated with ether (150 ml). The crystalline precipitate is filtered, the solid is rinsed with ether, dissolved in dimethylformamide (10 ml), and cooled at 0 \(\degree\)C. Disopropylethylamine (3 ml, 18.2 mmol) is added, followed by Boc-Met-OCH\(_3\)H\(_2\)NO\(_2\) (2.40 g, 6.5 mmol) and 1-hydroxybenzotriazole (0.99 g, 6.5 mmol). After 12 h at room temperature the solvent is evaporated in vacuo, the residue is dissolved in ethyl acetate (200 ml) and treated as described for 3. The resultant crystalline material is washed many times with ether and collected by filtration; yield: 2.8 g (76%); m.p. 142–144\(\degree\)C; \([\text{[r]}]^{20}\) = –32.0 (c 1.8, DMF); homogeneous by T.L.C.

\([\text{C}_2\text{H}_4\text{N}_4\text{O}_5\text{S}]\) calc. C 64.06 H 7.58 N 7.01
(599.9) found 63.85 7.48 6.76
Formyl-Met-Leu-Phe-OC\textsubscript{2}H\textsubscript{4} (5): Compound 4 (1.2 g, 2 mmol) is treated with trifluoroacetic acid (10 ml) for 40 min. The mixture is then evaporated in vacuo, the residue is treated with ether (100 ml), filtered, and the solid washed several times with ether. This product (0.5 g, 0.94 mmol) is dissolved in dimethylformamide (3 ml) and cooled to 0 °C. Disopropylethylamine (0.2 ml) and 2,4,5-trichlorophenyl formate (2; 0.27 g, 1.2 mmol) are added. After 12 h at room temperature, the mixture is treated as described above. The crystalline residue is triturated with ether, filtered, and washed several times with ether; yield: 0.387 g (92%); m.p. 134-136 °C; [α]\textsubscript{D}\textsuperscript{20} = -24.1° (c 1.0, DMF).

C\textsubscript{13}H\textsubscript{15}N\textsubscript{2}O\textsubscript{3}S calc. C 63.71 H 7.08 N 7.96 (572.8) found 63.66 6.88 7.78

Formyl-Met-Leu-Phe (6): Compound 5 (0.25 g) is hydrogenated in 10:1:1 dimethylformamide/disopropylethylamine/water (20 ml) with 10% palladium on barium sulfate as catalyst (30 mg) for 24 h. Most of the catalyst is then removed by filtration and the solution is concentrated in vacuo. The residue is dissolved in dimethylformamide (20 ml) and filtered through a column of neutral alumina (5 g). Elution is continued with dimethylformamide. Concentration of the solution and trituration of the residue with ether containing 1% acetic acid gives a white powder; yield: 0.22 g (80%); m.p. 220 °C; [α]\textsubscript{D}\textsuperscript{20} = -10.0° (c 1.04, acetic acid); homogeneous by T.L.C.
