Abstract: A rapid one-pot synthesis of 3-alkyl-5-[(Z)-arylmethylidene]-1,3-thiazolidine-2,4-diones is described that occurs in recyclable ionic liquid [bmim]PF₆ (1-butyl-3-methylimidazolium hexafluorophosphate). Significant rate enhancement and good selectivity have been observed.

Key words: three-component reaction, 1,3-thiazolidine-2,4-diones, ionic liquid

Combinatorial chemistry has gained importance as a tool for the synthesis of a wide variety of useful compounds including pharmaceuticals. In this context, the multiple component condensation (MCC) approach is especially appealing due to the fact that products are formed in a single step and diversity can be achieved simply by varying the reacting components. 3-Alkyl-5-arylmethylidene-1,3-thiazolidine-2,4-diones are an important class of synthetic intermediates in organic synthesis and many of these compounds display biological and pharmaceutical activities, such as anticonvulsant, antithelminthic, antitubercular, insecticidal, bactericidal, fungicidal, etc. Generally, 3-alkyl-5-arylmethylidene-1,3-thiazolidine-2,4-diones were prepared by the alkylation of 5-arylmethylidene-1,3-thiazolidine-2,4-diones or the condensation of 3-alkyl-1,3-thiazolidine-2,4-diones with aromatic aldehydes in refluxing DMF or toluene. These methods require first the preparation of the intermediates, 5-arylmethylidene-1,3-thiazolidine-2,4-diones or 3-alkyl-1,3-thiazolidine-2,4-diones and give low total yields. To the best of our knowledge, there is no report in the literature on the synthesis of 3-alkyl-5-arylmethylidene-1,3-thiazolidine-2,4-diones by ionic liquid-accelerated three-component reaction.

First, we investigated the three-component reaction of benzaldehyde (1a) and 1,3-thiazolidine-2,4-dione (2) with methyl iodide (3a) (Scheme 1). The results are presented in Table 1.

We found that in the presence of Et₃N, the reaction of benzaldehyde (1a) and 1,3-thiazolidine-2,4-dione (2) and methyl iodide (3a) in 1-n-butyl-3-methylimidazolium hexafluorophosphate ([bmim]PF₆) ionic liquid resulted in the formation of 3-methyl-5-[(Z)-phenylmethylidene]-1,3-thiazolidine-2,4-dione (4a) in 83% yield. The reaction proceeded smoothly at room temperature and was com-
completed within 2 hours. When the Et₃N was replaced by K₂CO₃, the yield of 4a was only 10% even after a long reaction period of 8 hours. Furthermore, we have performed the reactions in other solvents such as DMF, MeCN and toluene to compare the efficiency of the ionic liquid. The yields of 4a were 40%, 26%, and 13%, respectively, even after a reaction period of 10 hours. It is obvious that the ionic liquid [bmim]PF₆ can truly accelerate the three-component reaction of benzaldehyde (1a) and 1,3-thiazolidine-2,4-dione (2) with methyl iodide (3a) to form 3-methyl-5-[[(Z)]-phenylmethylidene]-1,3-thiazolidine-2,4-dione (4a) which was characterized by ¹H NMR, IR, and melting point, which were in good accordance with the literature data.²c

Then, the scope of the reactions of different aromatic aldehydes 1 with 1,3-thiazolidine-2,4-dione (2) and various alkyl halides 3 was investigated (Scheme 2). We found that the three-component reaction of aldehydes 1 with 1,3-thiazolidine-2,4-dione (2) and alkyl halides 3 occurred easily in [bmim]PF₆ in the presence of Et₃N to form the corresponding 3-alkyl-5-[(Z)-arylmethylidene]-1,3-thiazolidine-2,4-diones 4. The results are summarized in Table 2. In fact, simple stirring of a mixture of aldehydes 1, 1,3-thiazolidine-2,4-dione (2), alkyl halides 3 and Et₃N in [bmim]PF₆ at room temperature for methyl iodide (3a) or at 60 °C for other alkyl halides (3b–e) for 2–4 hours gave, after extraction with diethyl ether, the desired 3-alkyl-5-[(Z)-arylmethylidene]-1,3-thiazolidine-2,4-diones 4 in good yields and the reaction was found to be generally applicable. Different aromatic aldehydes containing electron-withdrawing substituent, such as nitro group, or electron-releasing substituent, such as methoxy group reacted successfully. Several alkyl halides containing chloro group, bromo group or iodo group succeeded.

¹ All reactions were run with aldehydes 1 (0.5 mmol), 1,3-thiazolidine-2,4-dione (2; 0.5 mmol), alkyl halides 3 (0.6 mmol) and Et₃N (0.6 mmol) in [bmim]PF₆ (2 mL).

² Isolated yields based on 1,3-thiazolidine-2,4-dione (2).
for primary and secondary alkyl halides especially. The Z or E configuration of all the products was determined by the prospective method to calculate the chemical shifts of the protons on variously substituted olefins. Sohda et al. have reported the calculated value of the methine protons of Z products in $^1$H NMR spectra to be 7.90 ppm, which is consistent with our tested value, and the value of E-products to be 7.42 ppm. In addition, the Z-products are more stable than the E-types.\(^5\)

The ionic liquid can be typically recovered by extracting out the product first, then washing the residue with water followed by vacuum drying. The recovered ionic liquid can be reused with no appreciable decrease in yield. The results are summarized in Table 3.

\(^a\) All reactions were run with benzaldehyde (1a; 0.053 g, 0.5 mmol), 1,3-thiazolidine-2,4-dione (2; 0.059 g, 0.55 mmol), and CH$_3$I (3a; 0.085 g, 0.6 mmol) in presence of Et$_3$N (0.061 g, 0.6 mmol) in \([\text{bmim}]\text{PF}_6\) (2 ml) at 25 °C.

\(^b\) Isolated yields based on 1,3-thiazolidine-2,4-dione

Under the same conditions, the reaction of rhodanine (2-thioxo-1,3-thiazolidine-4-one) with benzaldehyde (1a) and MeI (3a) was also investigated. But the expected product, 3-methyl-5-[(Z)-phenylmethylidene]-2-thioxo-1,3-thiazolidine-4-one was not observed.

In conclusion, we have provided a convenient and rapid method of synthesis of 3-alkyl-5-[(Z)-arylmethylidene]-1,3-thiazolidine-2,4-diones by ionic liquid accelerated three-component reaction. The simple operation combined with easy recovery and reuse of the reaction media (\([\text{bmim}]\text{PF}_6\)), makes this process economic and environmentally benign.

Melting points are uncorrected. IR spectra were recorded as KBr pellets on Vector-22 IR spectrophotometer. $^1$H NMR spectra were recorded on Bruker (400 MHz) spectrometer using TMS as an internal standard. Elemental analyses were performed on Carlo Erba EA 1106 instrument.
